

QUESTION 1: SOURCING METHODS

=====

1. Industry Association Directories (The "Membership" Filter)

Examples: ACMA (Auto Component Manufacturers Association), FOPE (Federation of Pharma Entrepreneurs), MCCIA (Maharatta Chamber of Commerce), FTAPCCI.

Why it works: Membership lists are curated. A company paying dues to an association like ACMA or FOPE signals an "Operator" mindset (C4) and a desire for structured growth (C7). It provides immediate segmentation (e.g., "Auto" or "Pharma").

Limitations: Lists often include small traders, service providers, and very small players who don't meet the revenue threshold. They usually lack revenue data.

2. PLI (Production Linked Incentive) Scheme Applicant Lists

Source: Government press releases and Ministry of Commerce databases for sectors like Pharma, Medical Devices, and Auto.

Why it works: This is a high-fidelity filter for C5 (Growing Sector) and C6 (Growth Signals). To apply for PLI, a company must meet minimum investment thresholds, implying financial health and a "Producer" status (E1).

Limitations: The public lists often contain the "large" players (>500Cr) alongside the targets. It requires cross-referencing with financial data to filter out the giants.
